BOLT CARRIER GROUPS

The DG Arms ESC - Enhanced Sand Cut complete bolt carrier group is the pinnacle of AR15 - M16 bolt carrier group production. We took our standard M1-Spec bolt carrier group and upgraded with real world no-nonsense features that make sense, not just make it flashy! First and foremost we looked to our roots in the FAL Battle Rifle and incorporated L1A1 style sand cuts on the entire load bearing surfaces of the carrier. These sand cuts allow any sand, dirt or debris that may have gotten into the action to easily be cycled out. After the sand cuts we knew we would have to give this bolt carrier group a finish that puts function over form, the DG Arms NTFE - Nickel Teflon finish. We chose Nickel Teflon due to its fantastic properties. These include increased lubricity, exceptional hardness and extreme corrosion resistance. Our NTFE finish has a lower friction coefficient than Nickel Boron and because the Teflon is impregnated into the Nickel it maintains the lower friction coefficient longer than Nickel Boron.
